Conrad Stanen BV | "More than 100 years of experience!"

Conrad Stanen BV

Conrad is a brand that has been representing quality for more than 100 years. A large diversity of customer-specific vertical drilling rigs are developed and produced with a team of committed employees. Conrad Stanen BV can develop a drilling rig that can fully fulfil your requirements with regard to the vertical drilling technique due to its extensive experience.

An extensive range of drilling rigs is available that ranges from jetting masts to the most advanced of fully automated drilling rigs that use the most diverse of drilling methods. Conrad Stanen BV will also assist you with all your drilling requirements such as drill pipes, bits, augers, etc.

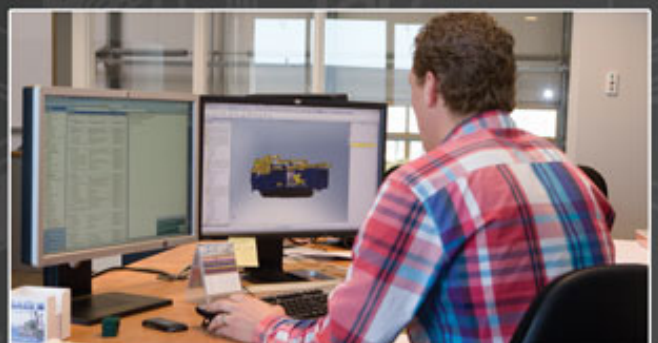

History

Conrad developed its first drill, the worldwide famous "Banka Boor", around a hundred years ago. This drill is still being produced today. This is because it is an ideal tool to explore inaccessible areas and swamps for heavy metals. The "Banka Boor" was followed up by a series of drills developed for mining, water wells and geotechnical application. Both the first PTO-driven rig and the first drilling rig with "Topdrive" were developed and produced within this context.

Company information

Customer-focused engineering:

Our engineers will work with you on producing the most practical rig geared towards your objectives. Because we fully focus on our customers, we can produce drilling rigs that fully meet your specifications.

"Conrad means quality"

Flexibility:

The power of Conrad Stanen is that the engineering, production, sales and service disciplines are all under one roof in a horizontal organisation. This means that flexibility dominates up to and including delivery but also aftercare for you as our customer. Conrad has now created many designs. We, however, do not rest on our laurels. We closely follow developments in the market. Flexibility and expertise form important lines of approach when it comes to determining our final approach.

Quality control:

Our engineering forms the basis for what will ultimately lead to a solid and user-friendly drilling rig. Quality control, therefore, is part of the complete construction process as from the start to commissioning. Every drilling rig is, moreover, extensively tested by an independent qualified inspection body before delivery takes place. Every rig that is delivered meets current safety standards.

Training:

The drilling rig must operate as efficiently as possible. Knowledge is transferred because one or more test drills are performed during initial customer drilling jointly with Conrad Stanen when the rig is delivered. Ultimately, your drilling rig operator will be able to perform drilling work independently.

After sales:

It is not the end of the line when we have delivered a drilling rig. Conrad provides direct and customer-friendly service that includes professional support to ensure the rig continues to produce at a high level in the future.
